

2D Engineering is ideally located next to a major communications focal point for the rest of Britain and the continent. 2D Engineering is an independent privately owned company formed in 1992 to supply high quality CNC machining using manufacturing methods and manufacturing equipment to service all areas of engineering.

Specialising in medium to low volume requirements here at 2D Engineering we pride ourselves on our willingness to tackle any obstacle.

Continuously re-investing in the latest manufacturing technologies no customer should feel that their requirement is too large or too insignificant to warrant our attention. If you have a product requiring machining just give us a call, our technically qualified staff have years of experience in solving problems, we may even have solved yours already! Founder & Managing Director Kevin Daniels has very much a hands on approach with the day to day operation of the company. He has followed a steady policy of expansion and re-investment with new CNC centres, new software and in-house programming to provide greater and more flexible services for customers.

Kevin's willingness to be involved in problem solving with customers has meant that he has over the years developed a loyal and varied customer base. "From magnesium alloy wheels for motorsport to pressure fittings in brass, customers come to 2D Engineering because we listen, we talk to the customer, we solve the problems together and we get the job done."

We operate in the engineering fields below:

- Aerospace
- Defence
- Scientific
- Electronics
- Automotive
- Petro Chemical
- Industrial Tooling
